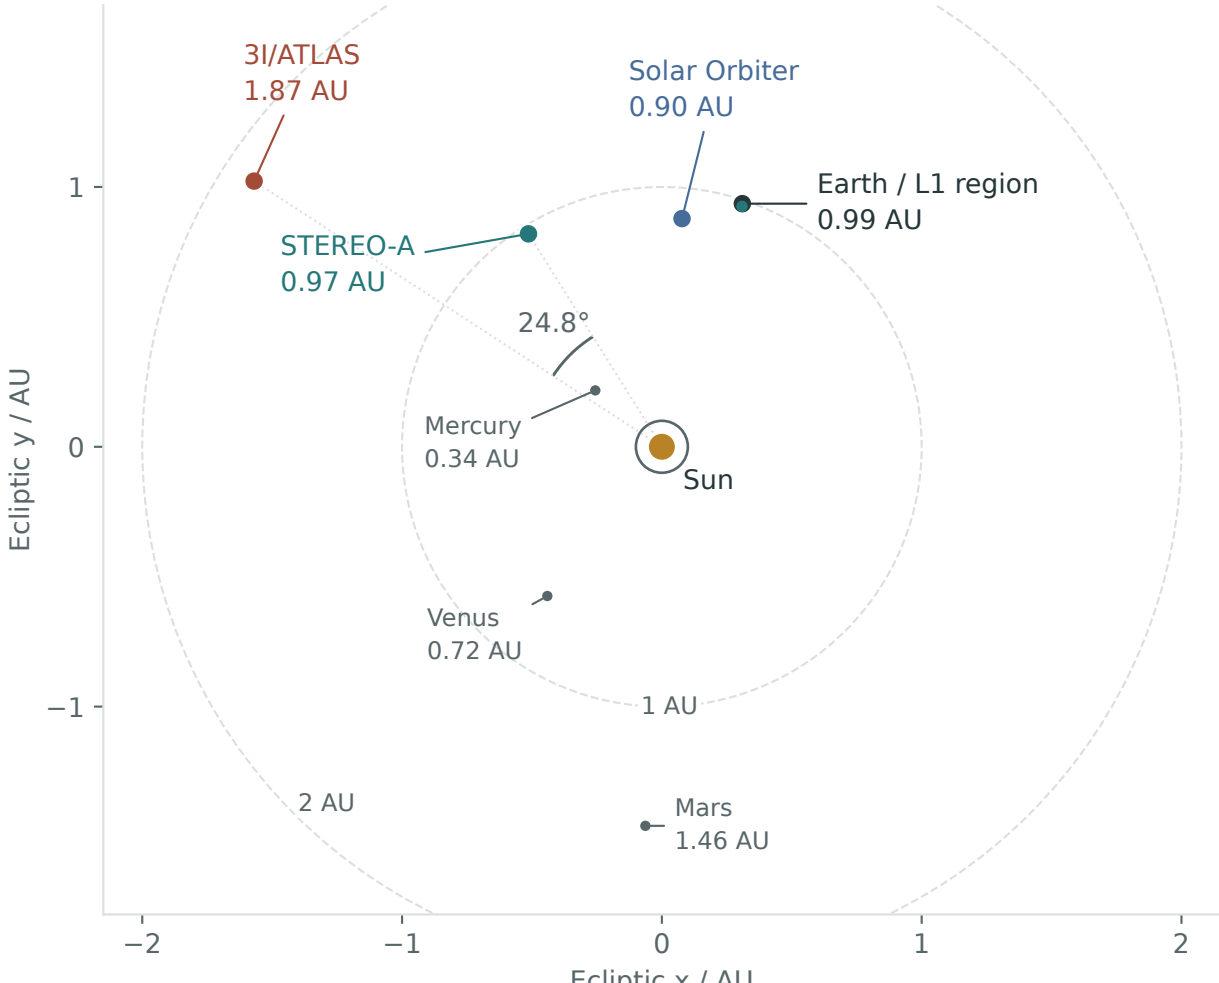
## Where the comet and the measurements were

3 December 2025, 23:00 UTC · top-down projection from ecliptic north



### Latitude matters

Latitude relative to the Sun's equator

| | |
|---|---|
| 3I/ATLAS | -6.45° |
| STEREO-A | -5.36° |
| Earth | +0.51° |
| Solar Orbiter | +9.44° |

STEREO-A is close in latitude, but about 25° away in longitude and roughly 0.9 AU closer in.

Wind and ACE lie near Earth; their separation is too small to resolve at this scale.

Dashed circles mark distances, not orbits. Small inner circle: 0.1 AU model boundary. Body symbols are enlarged.
